			1794	
MAIL DATE	DELIVERY MODE			
03/03/2009	PAPER			

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Office Action Summary	Application No. 10/581,816	Applicant(s) HONG, KYUNG JACK
	Examiner ALTREV C. SYKES	Art Unit 1794

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If no period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133).

Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

1) Responsive to communication(s) filed on 24 November 2008.
 2a) This action is FINAL. 2b) This action is non-final.
 3) Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

4) Claim(s) 5-22 is/are pending in the application.
 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
 5) Claim(s) _____ is/are allowed.
 6) Claim(s) 5-22 is/are rejected.
 7) Claim(s) _____ is/are objected to.
 8) Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

9) The specification is objected to by the Examiner.
 10) The drawing(s) filed on 24 November 2008 is/are: a) accepted or b) objected to by the Examiner.
 Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
 Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
 11) The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

12) Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
 a) All b) Some * c) None of:
 1. Certified copies of the priority documents have been received.
 2. Certified copies of the priority documents have been received in Application No. _____.
 3. Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Drawings

1. The drawings were received on November 24, 2008. These drawings are accepted by examiner.

Response to Arguments

2. Applicant's arguments filed November 24, 2008 have been fully considered but they are not persuasive.

Applicant argues Nordin does not disclose a composite of microfibers having a diameter of 1.0 denier or less and a super-absorbent region is made from fibers having a diameter of not greater than 1.0 denier.

Examiner is not persuaded. Examiner also notes that although written in an unusual way, both the stiff fiber region and super-absorbent region comprise fibers with diameters of 1.0 denier or less as recited in the amended claims. Nordin discloses that the shorter loops consist of microfibers having a diameter of at most 1 Dtex and longer loops having a fineness of at least 1Dtex. (See Col 1, lines 59-64) Therefore, examiner notes that the limitations of the newly amended claims are still anticipated by the Nordin prior art as both the short and longer loops can have a fineness of 1Dtex. Further, although Nordin does indicate short loops having a diameter of 0.3 Dtex and longer loops have a diameter of about 1.5 Dtex, these are described as examples only. Disclosed examples and preferred embodiments do not constitute a teaching away from a broader disclosure or nonpreferred embodiments. *In re Susi*, 440 F.2d 442, 169 USPQ423 (CCPA 1971). “A known or obvious composition does not become patentable simply because it

has been described as somewhat inferior to some other product for the same use." *In re Gurley*, 27 F.3d 551, 554, 31 USPQ2d 1130, 1132 (Fed. Cir. 1994)

Applicant provides no explicit traversal of the secondary and tertiary references except to say that Truong et al. and Kresse et al. do not cure the deficiencies with respect to Nordin.

Examiner is not persuaded. Examiner maintains the position as set forth above regarding applicant's arguments and maintains the rejections as set forth in the last mailed office action.

Claim Rejections - 35 USC § 102

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

4. Claims 5-14 are rejected under 35 U.S.C. 102(b) as being anticipated by Nordin. (US 5,804,274)

Regarding claims 5 and 7, Nordin discloses a cleaning cloth for cleaning dirty surfaces and a mop on which said cleaning cloth is arranged. (See Col 1, lines 5-7) The cleaning cloth is characterized by a base fabric having on one side longer loops of yarn with a normal fibre fineness and shorter loops of microfilament yarn having great dirt and liquid absorption ability and at the other side substantially microfilament yarn with great liquid absorption ability, preferably in the shape of short loops. (See Col 1, lines 48-54)

In regards to the limitation that the stiff fibers and the super-absorbent region are

alternately arranged, examiner notes the configuration of the fibers in Figure 1 of Nordin wherein ref. 3 represents the longer loop fibers and ref. 2 represents the short loop fibers in an alternating pattern of two long fibers followed by one short fiber followed by another set of two long fibers. It is noted that the short loop fibers would be equivalent to applicant's high absorbable fiber and the longer loop fibers would be equivalent to applicant's stiff fibers as further set forth in claims 8 and 9 below. Additionally, the limitation that the high-absorbable fibers (i.e. shorter loop microfibers) have a water retention rate greater than a water retention rate of said stiff fibers (i.e. longer loop staple fibres) would inherently be provided by as evidenced by the choice of fibers of both applicant and Nordin of polyester as set forth below. As such, the limitation is met and the burden is now upon the Applicant to prove otherwise. *In re Fitzgerald* 205 USPQ 594. Finally, the presently claimed water retention properties would inherently have been present once the Nordin product is provided. Note *In re Best*, 195 USPQ at 433, footnote 4 (CCPA 1977). Nordin discloses that the shorter loops consist of microfibers having a diameter of at most 1 Dtex and longer loops having a fineness of at least 1Dtex. (See Col 1, lines 59-64) Therefore, examiner notes that the limitations of the claims are anticipated by the Nordin prior art as both the short and longer loops can have a fineness of 1Dtex.

Regarding claim 6, Nordin discloses the ratio between shorter and longer loops on one side of the cloth should be such that 75%-25%, preferably 50% are made up by the shorter loops. (See Col 1, lines 65-67) As such it is noted that if 50% of the fibres on that

side of the cloth containing both fibers is 50% short then the other 50% would be the longer loops.

Regarding claim 8, Nordin discloses the longer loops should consist of yarn of filaments or staple fibres having a normal fineness of at least 1 Dtex. (See Col 1, lines 62-64) The normal yarn further consists wholly or partly of synthetic fibres of polyester. (See Col 2, lines 4-6) Therefore, the synthetic fibres of polyester would be equivalent to applicant's stiff fibers.

Regarding claim 9, Nordin discloses the shorter loops consist of yarn of microfilaments or microfibres having a fineness of at most 1 Dtex. (See Col 1, lines 59-61) The microfilament yarns consist suitably of synthetic fibres of polyester and polyamide. (See Col 2, lines 1-3) Therefore, the microfibers of polyester and polyamide would be equivalent to applicant's high-absorbable polyester microfibers. Nordin further discloses all yarns present in the cleaning cloth are suitably of synthetic material. (See Col 2, lines 44-45)

Regarding claims 10-11, Nordin discloses it is suitable that the base fabric is a woven or knitted cloth consisting wholly or partly of microfibers or microfilaments. (See Col 1, lines 55-58) The fabric may be woven or knitted with loops on both sides. It can, however, instead of having woven loops, be provided with yarn loops attached by sewing whereby loops are formed. (See Col 2, lines 36-39)

Regarding claims 12-14, Nordin discloses for Figure 2, a mop to be used with the cleaning cloth consisting principally of a telescopic pipe or shaft which is hingedly connected with a disc of aluminum or similar material. Velcro tape "males" moulded in

grooves are inserted on the underside of the disc. When the mop, the aluminum disc with the Velcro bands on the underside is simply pressed against the element of cleaning cloth which is to be used and the mounting is thereby complete. (See Col 4, lines 6-14) As such it is noted that the disc as disclosed by Nordin would necessitate the cloth being cut to a predetermined area in order to provide for a satisfactory mounting of the cloth to the disc necessary for the cleaning operation. Nordin also discloses if the cleaning element is to be removed it is possible to press one's foot against it and push off the aluminum disc. (See Col 4, lines 14-16) To use the mop in this way with Velcro tapes it is therefore necessary that the upper side of the cleaning element is constructed to serve as a female at the attachment with the Velcro tape. It is therefore suitable to sew together the cleaning cloth with a cloth which is intended to be the upper side which has the properties of being able to be attached to the Velcro bands. (Col 4, lines 17-23) As such, it is noted by examiner that the Velcro tape would be equivalent to a fastening means of a loop part of reclosable, hook and loop tape. Additionally, the matching up of the bands (i.e. sheets) of male and female grooves of the Velcro tapes attached to the disc and to the cleaning cloth would automatically provide for a margin of said fabric overlocking to a margin of said cloth.

Regarding claims 16-18, 20 and 22, it is noted by examiner that the methods of manufacturing a fabric comprising the steps as claimed by applicant are highly anticipated by Nordin as evidenced by the product construction thus formed. As there is no showing on the record that the method as claimed would lead to anything other than

the product as claimed by Nordin, the limitations are met because the steps are provided for in the outline of the product preferences.

Claim Rejections - 35 USC § 103

5. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.
6. The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:
 1. Determining the scope and contents of the prior art.
 2. Ascertaining the differences between the prior art and the claims at issue.
 3. Resolving the level of ordinary skill in the pertinent art.
 4. Considering objective evidence present in the application indicating obviousness or nonobviousness.
7. Claim 19 is rejected under 35 U.S.C. 103(a) as being unpatentable over Nordin (US 5,804,274) as applied to claim 16 above, in view of Truong et al. (US 2004/0074520).

Regarding claim 19, Nordin discloses all of the claim limitations as set forth above but the reference does not explicitly disclose the fibers includes circular-knitting the fibers. Nordin does disclose it is suitable that the base fabric is a woven or knitted cloth consisting wholly or partly of microfibers or microfilaments. (See Col 1, lines 55-58) The fabric may be woven or knitted with loops on both sides. It can, however, instead of having woven loops, be provided with yarn loops attached by sewing whereby

loops are formed. (See Col 2, lines 36-39) Nordin also discloses a dry or wrung-out cloth may then be used after cleaning. (See Col 3, lines 62-63)

Truong et al. discloses a cleaning implement comprising a cleaning support member, the cleaning support member having a substantially flat bottom surface and comprising fastening hooks on the bottom surface, and a reversible cleaning pad releasably attached to the bottom surface of cleaning support member. The reversible cleaning pad includes first and second sides, the first side of the cleaning pad comprises a first cleaning web material and the second side of the cleaning pad comprises a second cleaning web material, both web materials being directly attachable to fastening hooks. (See Abstract) Truong also discloses the microfiber web material is a knitted cloth web, either single knit or double knit, preferably prepared by the circular knitting process. (See [0054])

As Nordin and Truong et al. are both directed to cleaning cloths, the art is analogous. Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to utilize the circular knitting process as taught by Truong et al. in the place of the knitting process as disclosed by Nordin since the processes are held to be equivalent thereby yielding similar results of stitching. One would have been motivated to use the circular-knitting method since Truong discloses that knitting is preferred to weaving and provides an elastic cloth that is easier to wring out when wet. (See [0055])

8. Claims 15 and 21 are rejected under 35 U.S.C. 103(a) as being unpatentable over Nordin (US 5,804,274) as applied to claim 16 above, in view of Kresse (US 4,961,242).

Regarding claims 15 and 21, Nordin discloses all of the claim limitations as set forth above. Nordin discloses it is possible to arrange further absorption layers for water. This can suitably be done by inserting one or more layers of the cleaning cloth but even other absorption layers may be used. (See Col 4, lines 24-28) However, the reference does not specifically disclose a cloth wrapped about and stitched to respective margins of said fabric and said sheet. Additionally, the reference does not explicitly teach the fibers include tufting the fibers.

Kresse et al. discloses mop head covering for a wet mop, having the lowest possible inherent weight, high absorptive liquid uptake and liquid-retaining capacity with a simultaneously high dirt and dirty liquid uptake capacity. (See Col 1, lines 51-54) Besides areas with high liquid uptake capacity (sponge or fleece cloth material strips), areas with especially high soil, dirt, or solid material uptake capacity are provided by fringes, loops or tufts. (See Col 2, lines 14-19) On its underside, i.e., on the cleaning-active side, the textile supporting structure has strips of sponge cloth material arranged in rows adjacent and parallel to one another. These strips are arranged juxtaposed to one another in the longitudinal direction of the supporting structure, and in sectors along lines on the supporting structure. The strips manifest a length that is customary in the case of wet mop coverings and are sewn, tufted, glued, or welded onto the supporting structure. (See Col 2, lines 51-68)

As Nordin and Kresse et al. are both directed to cleaning cloths, the art is analogous. Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to utilize a mop head covering as taught by Kresse et al. as one of

the other absorption layers in the cloth as disclosed by Nordin. One would have been motivated by the desire to increase the liquid uptake and liquid-retaining capacity with a simultaneously high dirt uptake capacity thereby improving the cleaning process. (See Col 1, lines 51-54) Additionally, one would have been motivated to tuft the fibers of the Nordin cloth since Kresse et al. discloses that doing so to the fringes (or loops) of the mop cloth provides for fine hairs which retain the soil, dirt, and other small particles, especially well. (See Col 3, lines 2-3)

Conclusion

9. **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

10. Any inquiry concerning this communication or earlier communications from the examiner should be directed to ALTREV C. SYKES whose telephone number is (571)270-3162. The examiner can normally be reached on Monday-Thursday, 8AM-5PM EST, alt Friday.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, David Sample can be reached on 571-272-1376. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300. Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
